

# Age-related pancoronary vulnerability in patients with ST-elevation Myocardial Infarction

## Supplemental Methods

### The definitions in the clinical characteristics

Patients smoking actively within 1 month and no smoking for over 1 month were respectively defined as current smokers and former smokers. Diabetes mellitus was diagnosed once a patient met 1 of the following criteria: documented history or self-reported clinician diabetes mellitus, taking hypoglycemic medicine, fasting glucose  $\geq 126$ mg/dL, 2h plasma glucose level  $\geq 200$ mg/dL, classic symptom with casual plasma glucose level  $\geq 200$ mg/dL or hemoglobin A1c (HbA1c)  $\geq 6.5\%$ . Hypertension was diagnosed as systolic blood pressure  $\geq 140$ mmHg or diastolic blood pressure  $\geq 90$ mmHg or current use of antihypertensive agents. Dyslipidemia was defined as total cholesterol (TC) level  $\geq 220$ mg/dL, triglycerides  $\geq 150$  mg/dL, low-density lipoprotein cholesterol (LDL-C)  $\geq 140$ mg/dL, high-density lipoprotein cholesterol (HDL-C)  $\leq 40$ mg/dL, or current use of agents for dyslipidemia<sup>1</sup>. Estimated glomerular filtration (eGFR) was calculated according to the 2009 Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) equation. Chronic kidney disease (CKD) was diagnosed as eGFR  $< 60$ mL/min per 1.73 m<sup>2.2</sup>.

### The criteria in OCT analysis

A plaque was defined via OCT as a segment with a loss of the normal three-layered structure of the vessel wall<sup>3,4</sup>. Proximal and distal references were identified as the sites with the largest lumen area proximal and distal to the stenosis but within the same segment. The mean reference lumen area was calculated. Percent area stenosis was calculated as  $([\text{Mean Reference Lumen Area} - \text{MLA}] / \text{Mean Reference Lumen Area}) \times 100$ . On cross-sectional OCT images, quantitative analysis was conducted at 1-mm intervals. A distance of at least 5 mm was regarded as two separated lesions on the longitudinal view<sup>4</sup>. Lipid-rich plaques (LRPs) had a maximal lipid arc  $> 90^\circ$ . The lipid index was calculated using the mean lipid arc  $\times$  lipid length formula. Microchannels were the presence of small (50-300 $\mu$ m), signal-poor structures with vesicular or tubular shape without connection to the lumen, recognized on  $\geq 3$  consecutive cross-sectional images. Cholesterol crystals were thin and linear regions of high signal intensity with high backscattering within a plaque. Calcification was a signal-poor or heterogeneous area delimited by sharp borders. Calcification arcs were measured in each

cross-sectional image and lengths obtained on the longitudinal view. Calcified lesions subtending an arc  $\leq 90^\circ$  and extending in length for 1-4mm were classified as spotty calcium. The calcium index was derived as the mean calcium arc  $\times$  calcium length product. Thrombus was defined as an irregular mass (diameter  $> 250\mu\text{m}$ ) on the face of the vessel wall or floating within the lumen<sup>5,6</sup>.

## Supplementary Tables

### Supplemental Table S1 Patient-level OCT findings among age groups

Variables	Age ≤48 years (n =158)	48 < Age ≤56 years (n =140)	56 < Age ≤63 years (n =149)	Age >63 years (n =141)	P-value
<b>Non-culprit plaques</b>	<b>n=383</b>	<b>n=412</b>	<b>n=424</b>	<b>n=434</b>	
High-risk OCT features					
MLA <3.5 (mm <sup>2</sup> )	93 (58.9)	94 (67.1)	111 (74.5)	117 (83.0)	<b>&lt;0.001</b>
FCT <75 (μm)	56 (35.4)	70 (50.0)	76 (51.0)	66 (46.8)	<b>0.041</b>
Max lipid arc >180 (°)	55 (34.8)	68 (48.6)	77 (51.7)	75 (53.2)	<b>0.001</b>
Macrophages	101 (63.9)	99 (70.7)	113 (75.8)	112 (79.4)	<b>0.001</b>
Other features					
LRP	91 (57.6)	99 (70.7)	102 (68.5)	98 (69.5)	<b>0.043</b>
Cholesterol crystals	35 (22.2)	45 (32.1)	60 (40.3)	57 (40.4)	<b>&lt;0.001</b>
Microchannel	75 (47.5)	59 (42.1)	73 (49.0)	83 (58.9)	<b>0.032</b>
Calcification	61 (38.6)	60 (42.9)	97 (65.1)	102 (72.3)	<b>&lt;0.001</b>
Spotty calcification	55 (34.8)	53 (37.9)	83 (55.7)	87 (61.7)	<b>&lt;0.001</b>
Large calcification	25 (15.8)	34 (24.3)	71 (47.7)	77 (54.6)	<b>&lt;0.001</b>
Thrombus	8 (5.1)	11 (7.9)	23 (15.4)	20 (14.2)	<b>0.002</b>
Pancoronary vulnerability					
High-risk plaques	22 (13.9)	25 (17.9)	33 (22.1)	34 (24.1)	<b>0.016</b>
Non-culprit plaque rupture	13 (8.2)	25 (17.9)	24 (16.1)	20 (14.2)	0.167
Non-culprit TCFA	47 (29.7)	58 (41.4)	61 (40.9)	55 (39.0)	0.103

Values are presented as n (%), mean ± SD or median (25th-75th percentile). FCT=fibrous-cap thickness; LRP=lipid rich plaque; MLA=minimal lumen area; OCT=optical coherence tomography; SD=standard deviation; TCFA=thin-cap fibroatheroma.

**Supplemental Table S2 Univariable and multivariate analysis of high-risk plaques in STEMI patients ≤56 years**

Variables	Univariate analysis			Multivariate analysis		
	OR	95%CI	<i>p</i> -value	OR	95%CI	<i>p</i> -value
Culprit PR	3.562	1.767-7.182	<b>&lt;0.001</b>	3.179	1.501-6.733	<b>0.003</b>
Male	1.242	0.413-3.740	0.700
